

Rates of Suicide-Related Outcomes Among New Mexico High School Students (YRRS)

2009–2023

● Attempted Suicide
● Made a Suicide Plan
● Seriously Considered Suicide
● Treated for Suicide Attempt

Source: New Mexico Department of Health, 2009–2023 New Mexico Youth Risk & Resiliency Survey ("YRRS") for New Mexico high schoolers.

Note: This chart tracks four suicide-related mental health indicators reported by New Mexico high school students over a 12-month period via the YRRS (Youth Risk and Resiliency Survey) High School Survey. It includes the percentage of students who attempted suicide, made a suicide plan, seriously considered suicide, or required medical care following a suicide attempt. The national Youth Risk Behavior Survey (YRBS), which the YRRS is a part of, uses a three-stage cluster sample design to produce a representative sample of 9th through 12th grade students. The target population consisted of all public, Catholic, and other private school students in grades 9 through 12. A weighting factor was applied to each student record to adjust for nonresponse and the oversampling of Black and Hispanic students in the sample. The final, overall weights were scaled so the weighted count of students was equal to the total sample size, and the weighted proportions of students in each grade matched population projections for each survey year. Responses from respondents for which weights were not provided were dropped.
